

Keep the product in the product photo.

Compare the source photograph, downloaded output and verified product information. This is practical review guidance, not a measured accuracy study.

1. Label and model

Compare labels, model codes, units and logos against a verified product reference.

2. Shape and construction

Inspect handles, lids, seams, holes, fasteners and the number of visible parts.

3. Material and surface

Check texture, reflections, translucent edges and any condition detail buyers need.

4. Colour and variant

Keep identifying colours faithful and assign the output to the correct variant.

5. Scale and included items

Use verified dimensions and make clear which props or accessories are included.

6. Export and mobile view

Inspect the actual export for cropped edges, small text and compression artefacts.

Use preserved, changed, not assessable or not applicable. An unreadable source cannot establish whether exact text was preserved. Record uncertainty and the next action.
